SIGNED PROOF RECEIPTS

Eight screens, one argument.

-
- 01 The workstation home
 - 02 Visual workflow canvas
 - 03 Assist – one node, labelled
 - 04 Teams & policy diagnostics
 - 05 The runner that can say no
 - 06 Mission Control
 - 07 Receipt & Compliance Center
 - 08 Command palette

“MJ is a control and verification layer for agent organizations.”

– the shortest true sentence about this product, from its 11.10 review.

01 The workstation home

FIG. 01 — REAL CAPTURE, WEB EDITION

One surface for every agent workflow: live counts, hand-authored templates, and recents. The graph is the source of truth — 256 Hermes-class identities and 35 canvas frameworks ship in the box.

02 Visual workflow canvas

FIG. 02 — REAL CAPTURE, WEB EDITION

Typed ports, real wires, preflight linting. Security Audit ships as a hand-authored template: threat-model, review, judge, then a human approval gate before anything ends.

03 Assist – one node, labelled

FIG. 03 – REAL CAPTURE, WEB EDITION

Plain text becomes exactly one custom node. With no local model reachable, MJ inserts a deterministic offline draft and says so on the tin: nothing pretends to be AI that is not.

Seats carry role, harness, write-policy and timeout. MJ states plainly where enforcement is verified and where a role is advisory – read-only claims are checked, not assumed.

05 The runner that can say no

FIG. 05 – REAL CAPTURE, WEB EDITION

No harness detected? The mission aborts before any spend, the adversarial gate fails, the merge stays blocked – and a proof receipt records exactly that. Refusal is a feature.

Live fleet board, measured cost ledger, stagnation alerts and a human approval inbox. Every figure derives from fleet events the runner actually produced.

SHA-256 hash-chained receipts, Ed25519-signed by a local issuer key, retained $\geq$ 6 months. Export to SIEM, evidence pack, AIBOM – or verify any receipt with no MJ state at all.

08 Command palette

FIG. 08 – REAL CAPTURE, WEB EDITION

Ctrl+K reaches every command, node and template. When nothing matches, it says “the palette only offers what exists” – the whole product runs on that sentence.

Nothing here pretends.

Offline drafts are labelled. No model reachable → deterministic draft, tagged “offline draft – not AI output”.

Gates can fail, and do. A failed adversarial gate blocks the merge; the base branch stays untouched.

Refusal is recorded. “Nothing was executed and nothing was charged” – then a signed receipt says so.

Receipts verify externally. SHA-256 hash-chained, Ed25519-signed; checkable with no MJ state and no vault.

Compliance support, not compliance theatre. MJ is not “EU AI Act compliant” and sells no certification; it emits evidence (SOX 404 / SOC 2 CC8.1 / NIST 800-218A mappings) that supports your auditors.

This build, by the numbers.

CHECK	RESULT
TypeScript, strict	0 errors
Live test suite (Node 22)	59 / 59
Offline verification suites	58 / 58
Production build (vite)	clean
Archive re-verification	pass, incl. forced-branch env
Provenance format	mj-provenance-statement/1, in-toto shaped
Receipt chain	SHA-256 + Ed25519 issuer key
Retention floor	6 / 12 / 24 months, default 6

MJ 11.10.6

Built to be checked.

Desktop edition executes for real · web edition simulates with labels · both sign receipts.
